

III Worketa – Cachoeira Paulista (SP) – 24 a 29/10/2010

Estudo de Casos de Tempo Severo

Claudine Dereczynski (UFRJ)

Sumário

- 1) Santa Catarina (Nov/2008)
- 2) Litoral do Rio de Janeiro/Vale do Paraíba (Jan/2010)
- 3) Rio de Janeiro/Niterói (Abr/2010)
- 4) Pernambuco/Alagoas (Jun/2010)

**1) Santa Catarina
novembro 2008**

Histórico

- Entre os dias 21 e 25/11/08 o leste do Estado de Santa Catarina, principalmente o litoral norte, foi afetado por chuvas intensas, com totais pluviométricos que atingiram 693,0 mm em Luiz Alves em 4 dias.
- Registros: 135 mortes, 5617 desabrigados, 27236 desalojados, 14 municípios em estado de calamidade pública. A maior parte das mortes ocorreu no Vale do Itajaí e foi provocada por deslizamentos e soterramentos: 47 em Ilhota (Morro do Bau), 24 em Blumenau, 21 em Gaspar (Fonte: Defesa Civil de SC - <http://www.desastre.sc.gov.br/>).

Anomalia de Temperatura da Superfície do Mar NOV2008

Instituto Nacional de Meteorologia-INMET
chuva dia 23/11/2008 em Itapoá-SC

Resumo

- O evento de chuvas intensas ocorrido no leste de Santa Catarina entre 21 e 25/11/2008 foi provocado pela atuação de um bloqueio atmosférico na região:
 - Em superfície a alta do bloqueio foi responsável pelo aumento da intensidade dos ventos que atingiam perpendicularmente a costa, aumentando assim a convergência de umidade e a precipitação no litoral.
 - O vórtice ciclônico de núcleo frio (configurado entre 700 e 300 hPa), também associado ao bloqueio atmosférico do tipo dipolo, intensificou o movimento ascendente do ar. O contraste entre as elevadas temperaturas nos baixos níveis com o ar frio acima, pode ter colaborado para acentuar a instabilidade atmosférica
 - ATSMs positivas foram observadas no Oceano Atlântico durante o mês de novembro/2010
 - As chuvas atingiram 303,0 mm (dia 23/11) em São Francisco do Sul.

2) Litoral Rio de Janeiro/ Vale do Paraíba janeiro 2010

Histórico

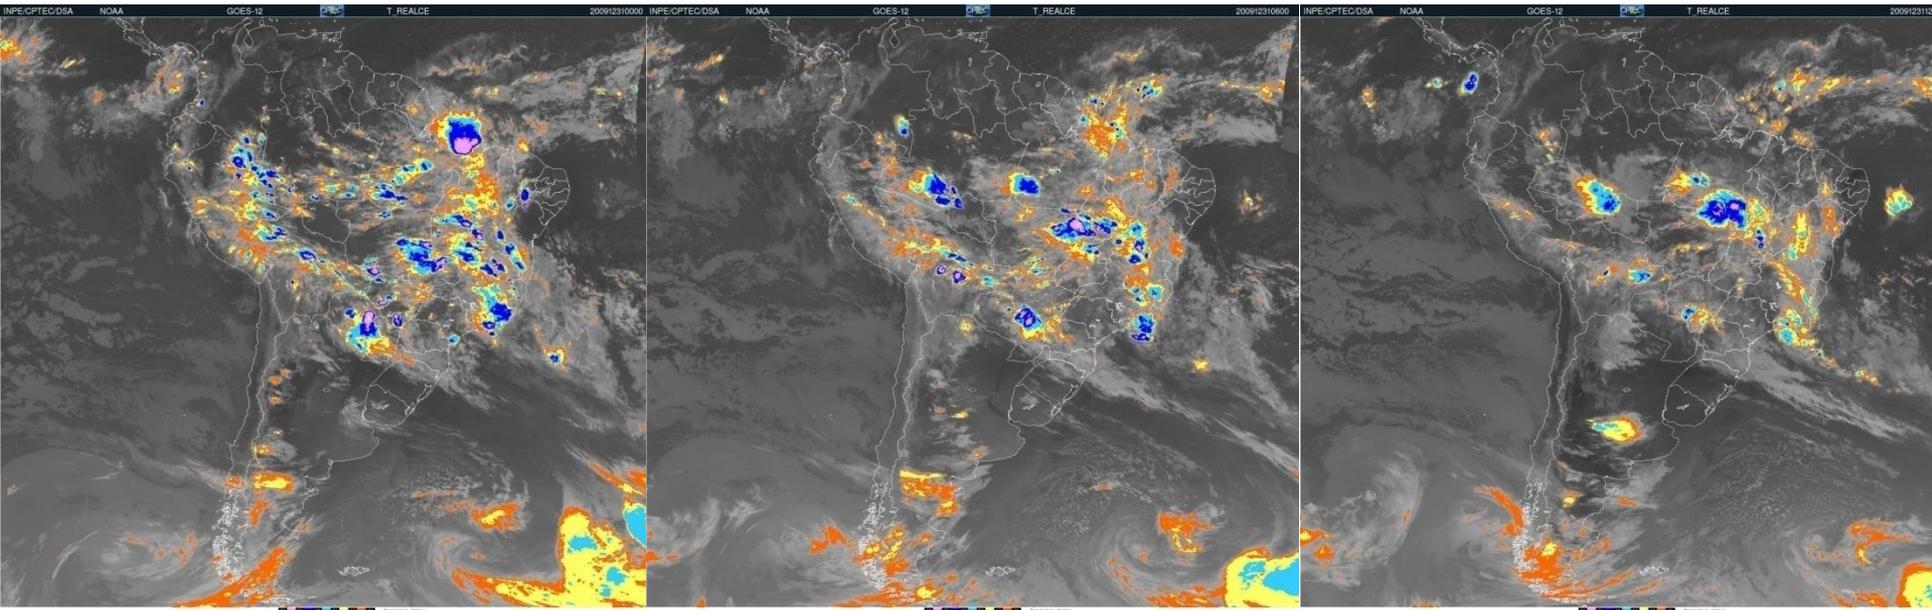

- No Réveillon de 2010 (entre 31/12 e 01/01/10) o sul do Estado do RJ foi atingido por chuvas fortes. Na Ilha Grande um deslizamento de terra destruiu uma pousada, 4 residências de moradores e 3 casas de veraneio. Entre Angra dos Reis e Paraty ocorreram 5 deslizamentos de terra. Até a manhã do dia 02/01 foram registradas 57 mortes em dois eventos de deslizamento, um na Ilha Grande e outro na parte continental de Angra dos Reis. Total pluviométrico: 142,9 mm
- Na Região do Vale do Paraíba (SP) ocorreram enchentes em Guaratinguetá, Aparecida, São Luiz do Paraitinga e Cunha. Cinco pessoas morreram em Cunha soterradas após deslizamento de terra.
- Em MG, 92 municípios afetados por enchentes, vendavais, deslizamentos de terra

Resumo

- As chuvas fortes que ocorreram no Réveillon de 2010 foram causadas por SCMs, formados dentro da massa de ar úmido e instável que dominava todo o Sudeste deste a última semana da dezembro de 2009;
- Nos baixos níveis, baixas pressões sobre parte do Rio de Janeiro e São Paulo, centro ciclônico até 500 hPa, elevadas temperaturas, convergência de umidade e escoamento de norte desde a região Amazônica, favorecendo o transporte de ar úmido da Amazônia;
- Movimento ascendente em 500 hPa;
- Nos altos níveis Alta da Bolívia (AB) e Vórtice Ciclônico do Nordeste (VCN) configurados

**3) Rio de Janeiro/Niterói
abril 2010**

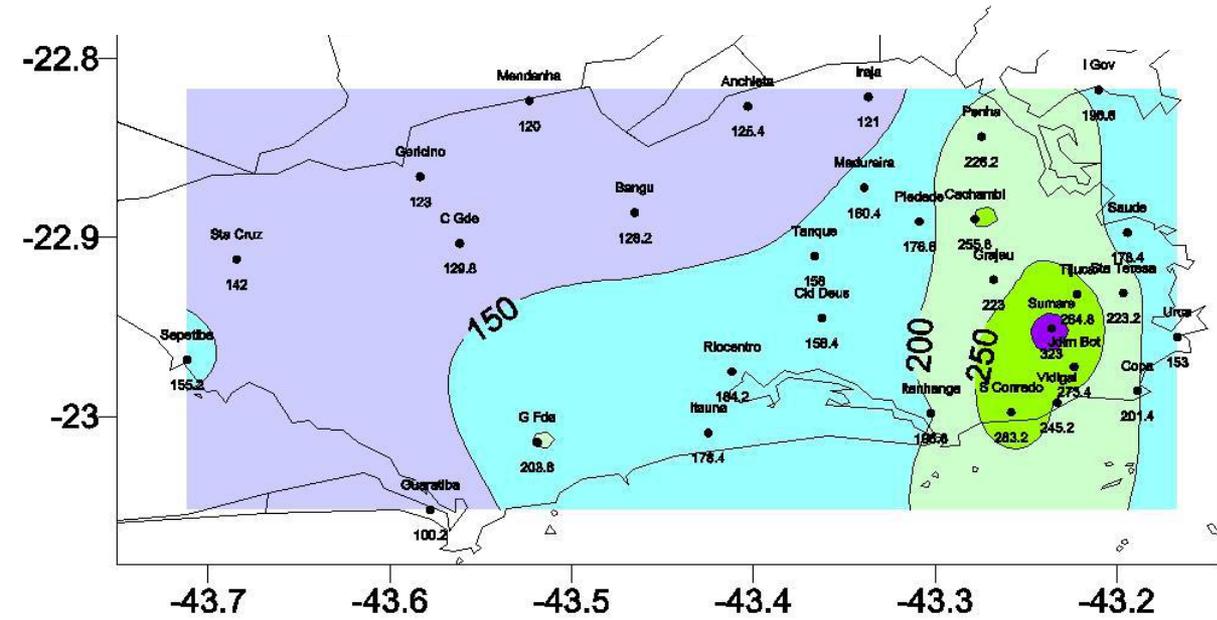

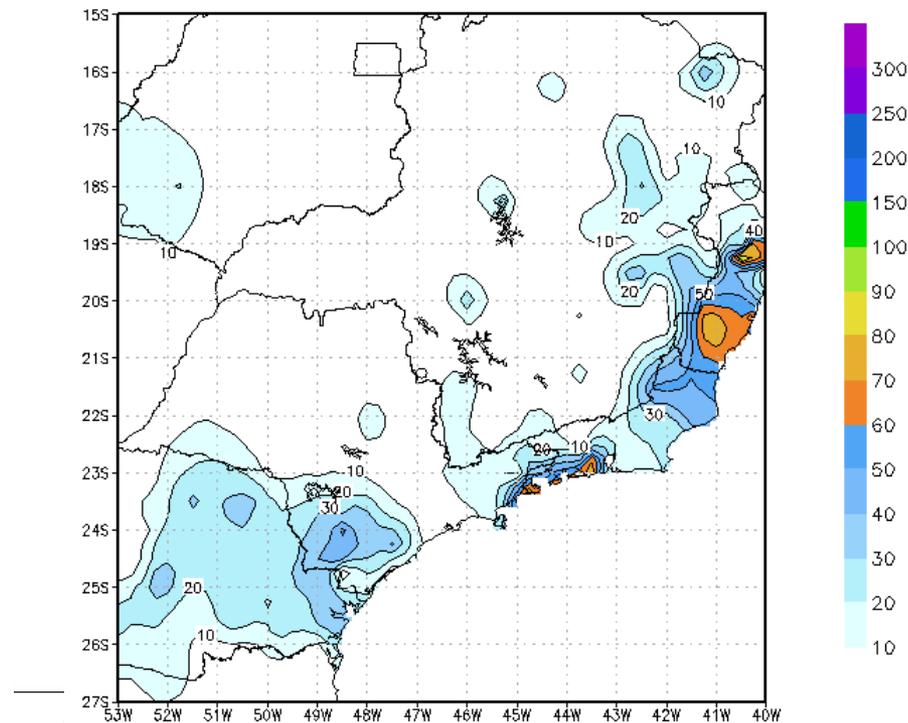

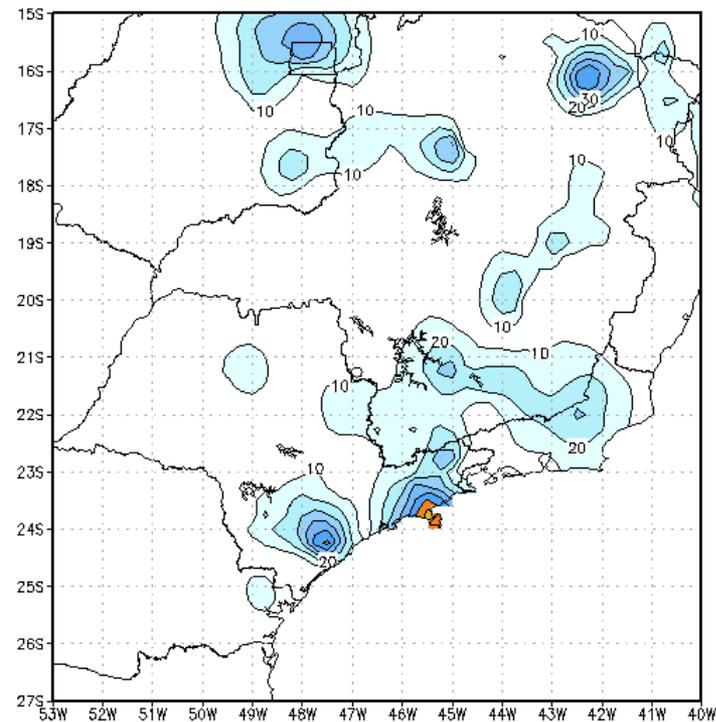

Histórico

- Entre os dias 5 e 6 de abril de 2010 as cidades do Rio de Janeiro e Niterói foram atingidas por chuvas intensas, com totais pluviométricos que atingiram 323 mm em 24 h.
- Registros: 167 mortes em Niterói, 66 no Rio de Janeiro causadas por deslizamentos de terra; 3262 desabrigados; 11439 desalojados

Anomalia de Temperatura da Superfície do Mar APR2010

Resumo

- O evento de chuvas intensas ocorrido no Rio de Janeiro entre os dias 5 e 6 de abril de 2010 foi provocado por um Sistema Convectivo de Mesoescala (SCM) associado a um sistema frontal (SF) que se deslocava pela região:
 - Em superfície a presença do centro de baixas pressões associado ao SF, promovia a convergência de umidade para o interior do continente.
 - Temperaturas elevadas na camada 500/1000 hPa antes da passagem do SF
 - Em 300 e 500 hPa um cavado pronunciado associado ao SF
 - Movimento ascendente na região do Rio de Janeiro
 - ATSM positivas (em torno de 1 a 1,5oC)
 - As chuvas atingiram 323,0 mm (dia 06/04) no Sumaré (Rio de Janeiro)

**4) Pernambuco/Alagoas
junho 2010**

Histórico

- Nos dias 16, 17 e 18 de junho de 2010, o litoral de PE foi afetado por chuvas intensas geradas por distúrbios ondulatórios de leste. Tais chuvas concentraram-se principalmente em Pernambuco (totalizando-se 348 mm em Recife nos três dias: 82, 116 e 150 mm) e os estragos em AL foram ocasionados por chuvas que ocorreram na cabeceira dos rios em PE e que se estendem pelo nordeste de AL (Fonte: CPTEC/INPE).
- Registros: Entre os dias 18 e 19/06 ocorreram 31 mortes em AL e 1 em PE. Ao todo 32000 desabrigados, 55000 pessoas afetadas, 6 desaparecidos, 13 deslizamentos de terra e 21 cidades com inundações devido a elevação do nível dos rios Mundaú, Canhoto e Camaragibe (Fonte: <http://www.defesacivil.gov.br/desastres/desastres/2010>)

Anomalia de Temperatura da Superfície do Mar JUN2010

Resumo

- As chuvas ocorridas no leste dos Estados de PE e AL em junho de 2010 foram causadas pela presença de distúrbios ondulatórios de leste:
 - Nos baixos níveis ventos atingindo a costa quase perpendicularmente, acentuando a convergência de umidade;
 - Em 500 e 700 hPa intenso sistema de alta pressão promovendo movimento ascendente nos baixos níveis.

Obrigada!

III Worketa – Cachoeira Paulista (SP) – 24 a 29/10/2010
